## Wisconsin County Coordinate Systems: WLIA Task Force Report on the Issues

## WSLS Annual Institute January 27, 2005

Ted Koch - State Cartographer
Diann Danielsen - LIO Manager, Dane County
Jerry Mahun - Civil \& Environmental Engineering Technology, MATC
Al Vonderohe - Dept. of Civil \& Environmental Engineering, UW-Madison

## Today's Presentation

Diann - WCCS: Why \& What + Concerns

Jerry - Wisconsin Coordinate Systems: The Technical Foundation

Al - WCCS: Emerging Issues and Solutions

Ted - Summary: Where are we headed?

## *) Mission:

년 Analyze and document the foundations of the WCCS
${ }_{4}$ Investigate, analyze and document software implementations of WCCS
눈 Investigate the redesign of the WCCS
6 Register WCCS with standards setting organization
눈 Document WCCS proceedings
6 Develop user-focused documentation
, Evaluate and make recommendations regarding statutory changes
6 Present TF recommendations to WLIA Board

- Brett Budrow St Croix County
- Tom Bushy ESRI
- Diann Danielsen Dane County
* John Ellingson Jackson County
- Bob Gurda State Cartographer's Office (ended 4/30/04)
- Pat Ford Brown County
- Gene Hafermann WI Dept of Transportation
- David Hart UW-Madison Sea Grant
- Ted Koch State Cartographer, Chair
- Mike Koutnik ESRI
- John Laedlein WI Dept of Natural Resources
- Tim Lehmann Buffalo County
- Gerald Mahun Madison Area Technical College
- David Moyer, Acting State Advisor Nat'l Geodetic Survey
- Kent Pena USDA-Natural Resources Conservation Service
- Karl Sandsness yres Associates
- Glen Schaefer WI Dept of Transportation
- Jerry Sullivan WI Dept of Administration
- Peter Thum GeoAnalytics. Inc.
- Al Vonderohe UW-Madison, Dep't of Civil \& Environmental Engineering
- Jay Yearwood City of Appleton
* AJ Wortley State Cartographer's Office

## Task Force Accomplishments

- 9 meetings in the past 12 months
- Documents:
: Equations \& Parameters for WI Coordinate Systems, (Jerry Mahun)
四 WCCS Test Point Data
n Products matrix
: Proposal to redesign the WCCS
- WTM parameters registered with ESPG
- Presenting TF work and conclusions to the professional community
- Local coordinate systems and the WCCS: Why and What + Concerns
m Diann Danielsen

## Why a Local Coordinate System?

Regional coordinate systems require ground-to-grid conversions to relate field surveyed coordinates to projected mapping coordinates
e Easy for staff to misapply or forget conversions

- Huge conversion effort for historic records
m Property maps have tens of thousands of ground-level distances on them. Too difficult to convert to map projections for GIS.
a Design drawings have tens of thousands of map projection distances on them. Too difficult to convert to ground distances for construction stakeout.

Three Surfaces Distances on property maps and construction stakeout Earth's Surface are measured here.

GIS spatial databases and design drawings are developed here.

## Wisconsin Local Coordinate Systems

- Old WisDOT county coordinate system used an average elevation and scale factor for each county to ease conversion between grid and ground values
- Typical project-based approach; does not preserve a precise mathematical relationship with other coordinate systems.
- Several Wisconsin counties began defining and adopting coordinate systems for local use
- WisDOT desired a unified set of county coordinate systems for the agency's large-scale mapping and roadway design activities that would be:
- Standardized and mathematically relatable to other systems
- Incorporate existing local county coordinate systems

## Solution....

- Develop map projections that are even more localized than state plane coordinate projections
- No significant differences between ground distances and map projection distances
- Ground distances can be used directly in spatial databases and grid (design) distances can be used directly for stakeout.

## Wisconsin County Coordinate System

- Fairview Industries was hired by WisDOT in 1993 to develop a consistent statewide set of county based coordinate systems
- This design raised the ellipsoid surface to near ground level to minimize ground and grid differences

## Wisconsin County Coordinate System

* 59 separate map projections (Lambert and Transverse Mercator)

낭 72 counties - some share a projection

## Use and Adoption of the WCCS

- Not officially adopted in statute (no current statutory home for coordinate system definition outside of a platting context)
- Chapter 236 updates were crafted to recognize and allow the use of WCCS for platting purposes
- WLIP \& Task Force surveys indicate the WCCS has been adopted for use in $3 / 4$ 's of Wisconsin counties

## Use and Adoption of the WCCS

- WCCS has become a key component of the WLIP, recognized as a voluntary or de facto standard, and supported by a number of educational resources
a Statewide educational rollout in mid-1990's
${ }^{3}$ Hardcopy and online resources

## Emerging Issues

- Multiple county coordinate systems
- Jackson County Official Coordinate System (county adopted)
- Jackson County Coordinate System (WisDOT developed)
* Different naming conventions
- Badger County Coordinate System; Badger County Geodetic Grid; Badger County Coordinate Grid; WCCS - Badger County; WCCS for Badger County; WCCS - Badger Zone
* Questionable use of datums
- WCCS designed specifically for use with NAD83(1991)
- WisDOT plats being filed using WCCS - Badger Zone; NAD83(1997)
* Variations create confusion when communicating and trying to convert data

## Other Concerns

## - Vendor Implementation

훈 Difficult because of the WCCS's unconventional design; mathematically correct, but less understood
bex Vendor implementation methodology differs, resulting in different coordinate values for the same feature

- Lack of Formal Registration
, : Some local systems adopted in ordinance; most are not
a Not registered with European Petroleum Survey Group/EPSG
- Aids consistent interpretation and implementation
- Lack of State Custodian/Oversight
tan systems or other spatial reference parameters (land and water datums, geoid models, ellipsoids, etc)

# Defining Concepts Coordinate System Development <br> Two-Dimensional Rectangular Coordinate Systems Formal Coordinate Systems in Wisconsin 

Jerry Mahun<br>Madison Area Technical College

## Defining Concepts

## To develop a coordinate system:

- Relate non mathematical three dimensional earth to a mathematical 3D model.
- Project 3D model into a 2D plane
- Define coordinate axes and units

## Defining Concepts

## Earth Models

Earth Physical Earth; Terrain
Entity on which measurements are made.

Geoid An equipotential surface
A surface on which gravity and centrifugal forces are balanced.

Directions of gravity

## Earth Models

Ellipsoid
The ellipsoid is a mathematical surface used to approximate the geoid.

## Ellipse Parameters

$a=$ semimajor axis
$b=$ semiminor axis
$f=$ flattening
$e=$ eccentricity
$f=\frac{a-b}{b}$
$e=\frac{\sqrt{a^{2}-b^{2}}}{a}$

## Ellipsoid

Typical Ellipsoids

Ellipsoid Clarke 1866 GRS 80
WGS 84
a (meters)
6,378,206.4*
6,378,137.0*
6,378,137.0*
$b$ (meters)
6,356,583.8*
$6,356,752.31414$
6,356,752.31424

*defining parameters

Fitting an Ellipsoid
Regional Fitting

Fitting an Ellipsoid
Global Fitting

## Fitting an Ellipsoid

## Fitting an Ellipsoid

H: orthometric height
N : geoid height
$(+)$ if geoid is above ellipsoid
(-) if geoid is below ellipsoid
h : ellipsoidal (geodetic) height

$$
h=H+N
$$

## Datum

## datum

Any quantity or set of such quantities that may serve as a reference or basis for calculations of other quantities.
datum, geodetic
A set of constants specifying the coordinate system used for geodetic control, i.e., for calculating coordinates of points on the Earth.

A datum consists of the ellipsoid and its geoid fit.

## Datum

| Datum | NAD 27 | NAD 83 |
| :---: | :---: | :---: |
| Ellipsoid | Clarke 1866 | GRS 80 |
| Fit to | North America | World |
| Criteria | Origin at Meades Ranch, <br> KS; no geoid separation. <br> Azimuth to Waldo fixed. | Ellipsoid centroid coincides <br> with earth's mass center. <br> Semiminor axis set <br> parallel with polar axis |
| Approx Number of <br> Control Stations | 25,000 | 272,000 |

NAD 83 has been adjusted three times in Wis:
NAD 83 (1986) - Original national adjustment
NAD 83 (1991) - WI HARN incorporated NAD 83 (1997) - Re-observed GPS stations

## Coordinate System Development

Three-Dimensional Reference System
Spherical Coordinates

## Coordinate System Development

## Three-Dimensional Reference System <br> Spherical Coordinates

## Coordinate System Development

Three-Dimensional Reference System
Geodetic Coordinates

Three dimensional position of a point is expressed by:
$\phi$ geodetic latitude
$\lambda$ geodetic longitude

## Coordinate System Development

## Three-Dimensional Reference System

Rectangular Coordinates

Earth Centered Earth Fixed (ECEF)
Rectangular Coordinate System
Three dimensional position of a point is expressed by $\mathrm{x}, \mathrm{y}$, and z

## Two-Dimensional Rectangular Coordinate Systems

## Building a Two-Dimensional Coordinate System

Projecting a 3-D surface into a 2-D surface causes distortions:
Linear and Angular

"Orange Peel" Map of the World

## Two-Dimensional Rectangular Coordinate Systems

## Building a Two-Dimensional Coordinate System

Length distortion occurs when projecting from:

- ground (Earth) to ellipsoid
- ellipsoid to projection surface

## Two-Dimensional Rectangular Coordinate Systems

## Building a Two-Dimensional Coordinate System

Direction distortion occurs because true north lines converge to a point (North Pole)

## Two-Dimensional Rectangular Coordinate Systems

"Developable" Surface and Projections
A developable surface along with fit criteria becomes a projection that can be used to define a coordinate system.

Three commonly used surfaces:
Plane
Cylinder
Cone
The developable surface is placed tangent or secant to the ellipsoid.
Points are projected from the ellipsoid to the developable surface.
The surface is rolled out flat without "tearing" the surface.
Because a projection is mathematical, distortions introduced can be compensated for mathematically.

Selecting the type, size, and orientation of the projection allows us to control "maximum" distortions.

## Two-Dimensional Rectangular Coordinate Systems

$$

## Formal Coordinate Systems in Wisconsin

Wisconsin State Plane Coordinate (SPC) Zones
NAD 27 and NAD 83

Three Lambert Conic Projection Zones
Maximum scale distortion
(ellipsoid to projection): 1/10,000

## Formal Coordinate Systems in Wisconsin

## Wisconsin State Plane Coordinate (SPC) Zones <br> NAD 27

NAD 27 uses the US Survey foot ( 39.37 inches $=1$ meter, exact) as the defining linear unit.

## Formal Coordinate Systems in Wisconsin

## Wisconsin State Plane Coordinate (SPC) Zones <br> NAD 83

NAD 83 datums use the meter as the defining linear unit.

## Formal Coordinate Systems in Wisconsin

## Universal Transverse Mercator (UTM) Zones NAD 27 and NAD 83

Maximum scale distortion
(ellipsoid to projection): 1/2,500
Two $6^{\circ}$ wide transverse cylindrical zones

UTM Zones are defined using the same parameters for both NAD 27 and NAD 83 datums:

|  | UTM Zone | UTM 15 N | UTM 16 N |
| :---: | :---: | :---: | :---: |
|  | Central Meridian | $93^{\circ} 00^{\prime} \mathrm{W}$ | $87^{\circ} 00^{\prime} \mathrm{W}$ |
|  | Latitude of Origin | $0^{\circ} 00^{\prime} \mathrm{N}$ | $0^{\circ} 00^{\prime} \mathrm{N}$ |
| $\mathrm{N}_{0}$ | Origin Northing | 0 m | 0 m |
| $\mathrm{E}_{\circ}$ | Origin Easting | $500,000 \mathrm{~m}$ | $500,000 \mathrm{~m}$ |
| $\mathrm{k}_{0}$ | Scale at Cen Mer | 0.9996 | 0.9996 |

UTM systems use the meter as the defining linear unit.

# Formal Coordinate Systems in Wisconsin 

## Wisconsin Transverse Mercator (WTM) Zone <br> NAD 27 and NAD 83

Maximum scale distortion
(ellipsoid to projection): 1/2,500
One $6^{\circ}$ wide transverse cylindrical zone

WTM is defined for NAD 27 and NAD 83.
A distinct "shift" of approximately 13 miles in northing and easting was introduced to the NAD 83 parameters to more easily distinguish the coordinate values:

|  |  | $N A D 27$ | $N A D 83$ |
| :--- | :---: | :---: | :---: |
|  | Central Meridian | $90^{\circ} 00^{\prime} \mathrm{W}$ | $90^{\circ} 00^{\prime} \mathrm{W}$ |
|  | Latitude of Origin | $0^{\circ} 00^{\prime} \mathrm{N}$ | $0^{\circ} 00^{\prime} \mathrm{N}$ |
| $\mathrm{N}_{0}$ | Origin Northing | $-4,500,000 \mathrm{~m}$ | $-4,480,000 \mathrm{~m}$ |
| $\mathrm{E}_{\mathrm{o}}$ | Origin Easting | $500,000 \mathrm{~m}$ | $520,000 \mathrm{~m}$ |
| $\mathrm{k}_{0}$ | Scale at Cen Mer | 0.9996 | 0.9996 |

The WTM system uses the meter as the defining linear unit.

Formal Coordinate Systems in Wisconsin

## Wisconsin County Coordinate System

NAD 83 (1991)

59 systems covering 72 counties
Conic or cylindrical projection
Each uses a "raised" ellipsoid
Maximum ratio: (grid to ground)
1/30,000 rural 1/50,000 urban

Formal Coordinate Systems in Wisconsin

## WCCS: Emerging Issues \& Solutions

A Al Vonderohe

## Emerging Issue

- Enlarging the ellipsoid has the mathematical effect of modifying the underlying geodetic datum.
- This has caused difficulties in both the vendor and user communities.
- Vendors want to support WCCS, but there is complexity.
- Most of the user community doesn't have a clue about datums and map projections.

## WLIA Task Force

The WLIA Task Force on Wisconsin Coordinate Systems was formed early this year to address this and other issues associated with location referencing in Wisconsin.
A question that emerged:
Can the WCCS be re-designed so that:
There is no need to change the ellipsoid from GRS 80. That is, there will be one datum for all projections.
2. Coordinate differences between the existing and redesigned systems will be within negligible bounds. In this way, legacy databases and records will not have to be modified.

- Leave the ellipsoid where it is and enlarge only the map projection surface.
This way, the ellipsoid factor and the scale factor are nearly inverses of one another and their product = 1 .

## Approach to Lambert Re-Design

## Two strategies:

Make the original and re-designed map projection surfaces be identical in threedimensional space.

- This will cause the latitude of the central parallel $\left(\phi_{0}\right)$ to change.
- Challenge: Finding $\phi_{0}$.

2. Hold $\phi_{0}$ constant.

- This will cause the original and re-designed map projection surfaces to be dissimilar.
- Challenge: Finding $\mathrm{k}_{0}$.

## Approach to Strategy 1

Work in geocentric coordinates (3D rectangular). Use analytical geometry.
Find equations of the line that is the projection of the central meridian.
Find the point of tangency between GRS 80 ellipsoid and a line parallel with the above line. Convert $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ of this point to $\phi, \lambda, \mathrm{h} . \phi$ is the latitude of the central parallel.

## Geocentric / Geodetic Coordinates

- Geocentric coordinates are based upon a 3D right-handed system with origin at ellipsoid center, XY plane is the equatorial plane, +X axis passes through $\lambda=$ $08,+Y$ axis passes through $\lambda=908 \mathrm{E}$.
- For any point, there are direct and inverse transformations between $X, Y, Z$ and
 $\phi, \lambda, h$.

## Approach to Strategy 1

Profile through GRS80, enlarged ellipsoid, and original map projection surface at $\lambda_{0}$ :

Geodetic coords $=\phi_{1}, \lambda_{0}, 0$; Compute $X, Y, Z$
Map projection surface

GRS 80

Find $X, Y, Z$ of point of tangency. Transform to $\phi_{0}, \lambda_{0}$, h.

NOTE: Two sets of geodetic coordinates; one set of geocentric coordinates.

## Approach to Strategy 1

## To find $\mathrm{k}_{0}$ :

## Approach to Strategy 1

There will be discrepancies because the two ellipsoids do not have the same shape.
Compute best fit translation in Y (change in false northing) and scale from sets of coordinates of points in both the original and re-designed systems.

Points should be well-distributed across geographic extent.
Apply these best fits to final re-designed parameters.

## Dane County Test of Lambert Methodology (Strategy 1)

$\Delta X=-0.003 m ; \Delta Y=0.000 m$
$\Delta \Delta X=-0.001 m ; \Delta Y=-0.001 m$

$$
\Delta \mathrm{X}=+0.002 \mathrm{~m} ; \Delta \mathrm{Y}=0.000 \mathrm{~m} \boldsymbol{\Delta}
$$

- $\Delta X=+0.001 m ; \Delta Y=-0.001 m$

$$
\Delta X=+0.003 \mathrm{~m} ; \Delta \mathrm{Y}=+0.001 \mathrm{~m} \bullet
$$

Approach to Transverse Mercator
Re-Design

Hold all parameters initially constant except $\mathrm{k}_{0}$.

- Compute new $k_{0}$ in manner similar to that for Lambert re-design.
Compute best fits for translation in $Y$ (false northing) and scale.Apply best fits to final parameters.
NOTE: Cannot hold map projection surface identical because the 2 cylinders have different shapes.

## Lincoln County Test of Transverse Mercator Methodology

- $\Delta X=-0.002 m ; \Delta Y=-0.002 m$
$\Delta \mathrm{X}=+0.002 \mathrm{~m} ; \Delta \mathrm{Y}=+0.002 \mathrm{~m} \bullet$

## Conclusions

- Under the re-design, all WCCS would have a single, common datum based upon the GRS 80 ellipsoid.
Initial tests indicate that WCCS can be redesigned to within 5 mm or better.
The WLIA Task Force has deemed 5 mm to be a negligible difference.
The WLIA Task Force is recommending redesign.

## Summary

-Where are we headed?

- Ted Koch

## Summary

Where are we headed?

- WCCS redesign proposal approved by WLIA - October '04
- WCCS redesign proposal approved by WLIB - November '04
- WLIB approves $\$ 35 \mathrm{~K}$ for redesign costs
- Contract for redesign through a single county using WLIB Strategic Initiative Grant

## Summary

Where are we headed? (Continued)

- WCCS redesign completed by Sept. '05
- WCCS redesign documentation completed by Dec. '05
- During '05, TF will continue to address issues of registration, legislation and use
- Prepare a TF final report
- Continue to inform the community
